

## **Environmental policy**

We confess to our ecological responsibility and try to reach a high capability with an environmental burden that is as low as possible.

### **Holistic and Sustainable**

Environmental policy means compliance with the relevant legal environmental regulations, but also to integrate the environmental aspects in the relevant operational flow and to increase our operational protection of the environment.

### **Focus**

On our way to an enduring environmentally compatible and sustainable development, our focus is the reduction of the resource consumption.

### **Dialog**

We communicate with our suppliers, customers and authorities to enable a responsible contact with the environment.

### **The Key**

Our employees are the key to a functional environment management system. Because of this, we integrate, inform and train them to be qualified for an active protection of the environment. The ongoing improvement of protecting our employees is also an engagement.

### **Ecology and Economics**

In our daily actions, we try to reconcile economic aspects with environmental protection where it is possible and useful. Making new investments, the best available technology is chosen having regard to our environmental aspects and particular buying criteria.

### **Prevention**

We always try to prevent influences on the environment at first hand. Where this is not possible, we try to reduce the influences regarding to amount and damaging effect.

### **Quality Feature**

We consider the environmental compatibility of products, processes and production to be an additional quality feature.
